

- ◆ The coupling series listed in this catalogue are applicable preferably to the equipment driven by steam turbines, gas turbines and all kinds of energy recovery turbines, to all kinds of turbine—compressors and other high speed power transmission.
- ◆ For some high speed applications or applications where the requirements for coupling weight are rigorous, TRUMY high performance flexible diaphragm coupling series may be selected.

# Brief introduction

Wuxi TRUMY Transmission Engineering Co., Ltd., former AVIC Num. 614 Research Institute Transmission Engineering Corporation, was founded in May 2001, has since then become a shareholding enterprise after system reforming. The corporation is engaged in research and development, manufacture, marketing and service of flexible couplings. TRUMY main products include: metallic flexible disc coupling, metallic flexible diaphragm coupling, grid coupling, among them metallic flexible laminated membrane coupling and metallic flexible diaphragm coupling were awarded second prize of science and technology progress by Ministry of Aviation Industry in 1990, accredited as one of the high-tech products of Jiangsu province in 1999.

Since the early 1980s the AVIC Num. 614 Research Institute has begun designing and application researching of metallic flexible couplings and formed a complete proprietary technology system. TRUMY carries on the proprietary technology of its predecessor, Num. 614 Research Institute, possesses sophisticated design computation technique and verification facilities, has accumulated a wealth of experience in product research & develop, design and application to processing power equipment and provided various solutions to flexible power transmitting sets for the industries.

TRUMY products passed ISO9001 quality system certification in 2003, GJB9001 quality system certification in 2007. The corporation has been accredited as a Hi-tech Enterprise of Jiangsu Province for consecutive years since 2003. Over 20 years TRUMY and its predecessor have built long term cooperative relationships with numerous well known processing power equipment manufacturers at home as well as abroad, supplied hundreds of thousands high quality coupling sets for industries.

# CONTENT

Couplings with a disc pack, spacer and sleeve joint integrated into a subassembly for delivery, dynamic balance precision well kept, easy to operate, first choice for most middle/high speed applications.

## **HBD** Series

A derivative from HGD series, designed with a double way transmitting mechanism, to protect turbine equipments from load throw-off.

# **TDH Series**

Couplings having advantages of HGD series, but not so high configuration, able to be partly substituted for HGD series as an option for middle/high speed applications.

#### **GD** Series

Couplings with small external sizes, enabling disc packs to be replaced separately, able to be substituted for TGD series, suitable for middle/high speed applications where coupling external sizes are limited.

#### TGD Series

Main choice for high speed turbine-compressor set applications, couplings with small external sizes and small additional bending moment, with disc packs allowed to be replaced separately, hub designed with an inversion form.

## **TDS Series**

Small dimension couplings with a disc pack, spacer and sleeve joint integrated into a factory-assembled unit, dynamic balance precision well kept, hub designed with an inversion form, the additional bending moment reduced, applicable to high speed turbine-compressor sets.

### **TDR Series**

Couplings having advantages of TDS series and smaller additional bending moment, suitable for high speed applications where requirements for additional bending moment are ultra rigorous.

# **TDX** Series

Small dimension couplings with centering rings set on each disc pack, suitable for limited axial size and middle/high speed applications.

# Coupling series designation

TRUMY coupling designation consists of 5 groups as follows:

<u>HGD6</u> <u>420</u> - <u>100 × 120 / 85 × 100</u> - <u>460</u> - <u>00T1</u>

Group A is composed of letters and figures, indicating coupling type and the number of holes in a disc respectively

Figure notation: 6 indicating 6 hole disc

8 indicating 8 hole disc

10 indicating 10 hole disc

Group B represents the grade of torque transmission of the coupling. A bigger grade value corresponds to a higher torque transmitted by the coupling. When the torque < 100KNm, the grade value represents the power (Kw) transmitted per 1000 r/min. When the torque is more than or equals to 100KNm, the grade value represents the power (Kw) transmitted per 1 r/min, in figures "XX" of "90XX", where 90 is a prefix.

Group C represents fitting diameters and lengths of the driving and driven shafts, where the numerator and denominator denote the driving and driven shafts respectively.

Group D represents the distance between the driving and driven shaft ends

Group E shows design number of the coupling

# Type characteristics and guide to coupling selection

TRUMY high performance flexible disc couplings are high quality torque transmitting products developed specially for high speed rotary machinery. The flexible elements are thin metal discs made from high strength steel. Having passed finite element analysis and from optimization, all types of the metal discs of the optimization all types of the metal discs of the optimization all types of the metal discs of the optimization all types of the metal discs of the optimization all types of the metal discs of the optimization all types of the optimization bearing components made from alloy steel have high strength as well as good comprehensive performances through quenching and tempering. The TRUMY high speed-high performance flexible disc couplings possess outstanding advantages such as:

- High strength, good flexibility, good comprehensive performances;
- Light weight, high power density, small affect to the machines;
- Small additional bending moment, especially suitable for turbine- compressor sets;
- Membranedisc with optimized profile has big capacity to compensate misalignments
- 1.The coupling series listed herein are mainly applicable to the equipment driven by steam turbines, gas turbines and various kinds of energy recovery turbomachines, or to high/middle speed power transmission after the speed-increasing gear driven by electric motors or internal combustion engines. For pumps, fans and compressors directly driven by electric motors or internal combustion engines, also for middle/low speed power transmission after the reductor driven by turbo-machinery, TRUMY middle/low speed flexible disc coupling series or grid coupling series should be the first priority in selection.
- 2. Coupling selection recommendations for high/middle speed applications:
  - a:Series HGD are preferred. If the safety protection type with back-up gears is needed, series HBD, TGD or GD should be selected.
  - b:If the coupling external dimensions are limited, series TGD or GD should be the first priority. For speed over 13000r/min applications series TDS or flexible diaphragm couplings are recommended.
  - c:The series TDR or DM flexible diaphragm couplings may be applicable to those situations, where the machines are especially sensitive to coupling weight and
- 3. This catalogue is mainly compiled for common industry uses. For such special applications as test beds, super-high speed equipment and the special equipment requiring super high misalignment compensating capability, customers may not always find suitable couplings from the catalogue. In this case please contact TRUMY sales engineer, the company will carry out special design to meet customer particular requirements.

# Selection procedure

Whenever you have questions about coupling selection, please contact TRUMY sales engineer. Jointly selecting TRUMY couplings by both supply and demand sides is recommended

- According to driving and driven machines and operation conditions, select a service factor K from the table below.
- 2. Determine coupling calculation power rating Pc

 $Pc=P\times K$ 

Pc -- calculation power (kw); where:

P transmitting power (kw). Taking into account that the driven machine may work under overload conditions, suggest that P is calculated according to the power value of the driving machine;

K -- service factor

3. Calculate transmitting torque of the coupling

T=9549 x PC / n where: T- torque (N.m);

n- rated or normal working speed ( r/min ) .

4. Following the guide to coupling selection ,tentatively select coupling type according to the conditions T≤continuous torque rating and nmax≤max. speed.

- 5. Check the operating conditions
- a. Check up peak torque and max. transient torque with the requirements of the machines. For the machines starting frequently and those with big start-up shock the starting torque should be checked. For the machines equipped with brake apparatus the braking torque should be checked. If specified, for power generation packages or machine driven by synchronous motors the transient torque associated with generator short torque or the cyclic torque associated with synchronous motor start-up should be checked. If necessary, select the types with higher parameter values or select other coupling series.
- b. Check up the coupling type selected with the requirement for max. allowable shaft diameter. If necessary, select the types with higher parameter values or select other coupling series.
- c. Check up the distance between shaft ends (DBSE) with the requirement for min. DBSE of the coupling type selected. Appropriate DBSE enables not only the coupling to realize better performances but also the machines to be easily maintained. If required, DBSE should be in accordance with API610 or API671
- d. Check up the capacity to accommodate axial displacement and angular misalignment of the coupling selected with requirements of the machines.If necessary, select the types with higher parameter values or select other coupling series. For the machines with larger thermal expansion the coupling may be processed by cold pre-stretching so that the coupling works in a small deformation state when the machines are thermally balanced in operation.

### Service factors

D. 4.		Drivir	ng machine	
Duty	Driven machine	electromotor,steam or gas turbines	Steam engine or water turbine	Internal combustion engine
Constant torque	Centrifugal pumps, light conveyors, alternators, light fans	1. 0 *	1. 5	3. 0
Slight torque fluctuations	Machine tools, screw compressor, screw pumps, iquid ring compressors, rotary dryers	1. 5	2. 0	3. 5
Substantial torque fluctuations	Reciprocating pumps, low viscosity mixers, cranes, winches	2. 0	2. 5	4. 0
Exceptionally high torque fluctuations	Rotary presses, reciprocating compressors, high viscosity mixers, marine propellers	3. 0	3. 5	5. 0

\* For the gear box the value of the factor 1.25 may be adopted, for direct electromotor start-up --- 1.5, according to the requirements in API671 the minimum is 1.5. When needed, the service factor value may be increased or decreased, following the relative rules in API671.

If the customer can not find the corresponding types of driving or driven machines recommended in the table, please select the service factors from AGMA 514.02 or consult TRUMY sales engineer

# **HGD Series**

- ◆Main choice for middle/high speed applications.
- ◆ Factory—assembled middle transmitting unit, dynamic balance precision well kept, easy to mount/dismount.
- ◆ Big hub design for relatively large allowable shaft diameters.
- ◆ Adjusting shims provided to adjust magnitude of prestretching or mounting error.

#### RSV Industries Pvt. Ltd. www.rsvindustries.com sales@rsvindustries.com +9174004 33355

#### Direction for use

- 1. Bore diameter D, hub outside diameter C, hub length E, distance between flange mating faces F may be designed separately according to the matching requirements of the machines.
- 2. Based on the needs the connection between the driving and driven machines may be designed with taper bored hub (with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting
double key connection	P7	h6	Hot mounting
Interference fit, without key connection	I magnitude of interference	cording to shaft tolerance, needed can be determined ng to GB/T 5371 or API671.	Hot mounting or oil pressure mounting

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between flange mating faces. For other sizes of bore diameter, hub outside diameter and distance between flange mating faces, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between flange mating faces the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_T} + \frac{\Delta L}{\Delta K_T} \quad \text{where K-torsional stiffness for a given distance between flange mating faces, K_T- torsional stiffness shown in the catalogue, <math>\Delta K_T$ - torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L$ - variation of size F relative to TRUMY standard distance between flange mating faces.

- 4. The standard distance between flange mating faces F is in accordance with the requirements in section 8.3, API671(the 4-th edition). The "minimum" distance between flange mating faces is referred to as the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# **HBD Series**

- A derivative from HGD series, optional for middle/high speed applications
- ◆ Double way transmitting mechanism (back-up gears) to protect turbine machines from load throw-off.
- Factory—assembled middle transmitting unit, dynamic balance precision well kept, easy to mount/dismount.
- ◆Big hub design for relatively larger allowable shaft diameters.
- Adjusting shims provided to adjust magnitude of pre-stretching or mounting error

## RSV Industries Pvt. Ltd. www.rsvindustries.com sales@rsvindustries.com +9174004 33355

#### Direction for use

- Bore diameter D, hub outside diameter C, hub length E, distance between flange mating faces F may be designed separately according to the matching requirements of the machines.
- Based on the needs the connection between the driving and driven machines may be designed with taper bored hub (with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting
double key connection	P7	h6	Hot mounting
Interference fit, without key connection	magnitude of interference	cording to shaft tolerance, needed can be determined ng to GB/T 5371 or API671.	Hot mounting or oil pressure mounting

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between flange mating faces. For other sizes of bore diameter, hub outside diameter and distance between flange mating faces, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between flange mating faces the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_T} + \frac{\Delta L}{\Delta K_T} \quad \text{where K-- torsional stiffness for a given distance between flange mating faces, K_T-- torsional stiffness shown in the catalogue, <math>\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue and  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue and  $\Delta K_T$ -- torsional stiffness for spacer tube per meter as shown in the catalogue.

- 4. The standard distance between flange mating faces F is in accordance with the requirements in section 8.3, API671(the 4-th edition). The "minimum" distance between flange mating faces is referred to as the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# TDH Series

- An option with lower configuration for middle/high speed applications.
- Able to be partly substituted for HGD series, high performance-price ratio.
- ◆Factory-assembled middle transmitting unit, dynamic balance precision well kept, easy to mount/dismount.
- ◆Big hub design for relatively large allowable shaft diameters.
- ◆ Adjusting shims provided to adjust magnitude of prestretching or mounting error.

#### RSV Industries Pvt. Ltd. www.rsvindustries.com sales@rsvindustries.com +9174004 33355

#### Direction for use

- 1. Bore diameter D, hub outside diameter C, hub length E, distance between flange mating faces F may be designed separately according to the matching requirements of the machines.
- Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
	1.17	k6 m6 n6	Hot mounting
Interference fit, with single or double key connection	H7	r6 s6 t6 u6	Hot mounting
double key confidention	P7	h6	Hot mounting
Interference fit, without key connection	Bore tolerance defined ac magnitude of interference by the calculation accordir	needed can be determined	Hot mounting or oil pressure mounting

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between flange mating faces. For other sizes of bore diameter, hub outside diameter and distance between flange mating faces, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between flange mating faces the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_{\text{T}}} + \frac{\Delta L}{\Delta K_{\text{T}}} \quad \text{where K- torsional stiffness for a given distance between flange mating faces, K_{\text{T}}- torsional stiffness shown in the catalogue, <math>\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L-$  variation of size F relative to TRUMY standard distance between flange mating faces.

- 4. The standard distance between flange mating faces F is in accordance with the requirements in section 8.3, API671(the 4-th edition). The "minimum" distance between flange mating faces is referred to as the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# GD Series

- ◆An option for middle/high speed applications
- ◆Relatively small external sizes
- Equipped with adjusting shims to adjust the amount of pre-stretching or installation error.
- ◆ Double way transmitting mechanism (back-up gears)used for protecting turbine machines from load throw-off.
- ◆Enable disc packs to be replaced separately.

#### Direction for use

- Coupling longth B, Bore diameter D, hub outside diameter C, hub length E, distance between flange mating faces F
  may be designed separately according to the matching requirements of the machines.
- Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting
double key connection	P7	h6	Hot mounting
Interference fit, without key connection	magnitude of interference	cording to shaft tolerance, needed can be determined ng to GB/T 5371 or API671.	Hot mounting or oil pressure mounting

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between flange mating faces. For other sizes of bore diameter, hub outside diameter, distance between flange mating faces, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between flange mating faces the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_{\tau}} + \frac{\Delta L}{\Delta K_{\tau}} \quad \text{where K- torsional stiffness for a given distance between flange mating faces, K_{\tau}- torsional stiffness shown in the catalogue, <math>\Delta K_{\tau}$ - torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L$ - variation of size F relative to TRUMY standard distance between flange mating faces.

- 4. The standard distance between flange mating faces F is in accordance with the requirements in section 8.3, API671(the 4-th edition). The "minimum" distance between flange mating faces is referred to as the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# TGD Series

- ◆An option for middle/high speed applications ◆Hubs in an inversion form, small additional bending moment, especially suitable for turbinecompressors sets. ◆Relatively small external sizes ·Adjusting shims provided to adjust magnitude
  - ◆Double way transmitting mechanism (back-up gears) equipped to protect turbine machines from load throw-off. ◆Enable disc packs to be replaced separately.

of pre-stretching or mounting error.

If required, the coupling may be designed with one hub in the inversion form, another in the normal form as shown in the left

### Direction for use

- 1. Coupling length B, bore diameter D, hub outside diameter C, hub length E, distance between shaft ends S may be designed separately according to the matching requirements of the machines
- 2. Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended by TRUMY

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting
double key connection	P7	h6	Hot mounting
Interference fit, without key connection	magnitude of interference	cording to shaft tolerance, needed can be determined ng to GB/T 5371 or API671.	Hot mounting or oil pressure mounting

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between shaft ends. For other sizes of bore diameter, hub outside diameter and distance between shaft ends, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between shaft ends the torsional stiffness K can be calculated using the formula as follows:

$$\frac{1}{K} = \frac{1}{K_{\text{T}}} + \frac{\Delta L}{\Delta K_{\text{T}}} \quad \text{where K-torsional stiffness for a given distance between flange mating faces, K_{\text{T}}-torsional stiffness shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L_{\text{T}}-$  torsional stiffness fo$$

- 4. The standard distance between shaft ends Sstd is in accordance with the requirements in section 8.3, API671(the 4—th edition). The "minimum" S or "minimum" F is referred to as the shortest distance between shaft ends or the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# **TDS Series**

- Hubs in the inversion form, small additional bending moment, especially applicable to high speed turbine —compressor sets.
- ◆ Factory—assembled flexible unit, dynamic balance precision well kept.
- ◆ Relatively small external sizes
- Adjusting shims provided to adjust magnitude of prestretching or mounting error.
- Keyless interference fit for hub-shaft connection is recommended.

#### Direction for use

- Coupling length B, bore diameter D, hub outside diameter C, hub length E, distance between shaft ends S may be designed separately according to the matching requirements of the machines.
- 2. Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended by TRUMY.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method				
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting				
double key connection	P7	Hot mounting					
Interference fit, without key connection	Bore tolerance defined ac magnitude of interference by the calculation according	Hot mounting or oil pressure mounting					

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between shaft ends. For other sizes of bore diameter, hub outside diameter and distance between shaft ends, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between shaft ends the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_{\text{T}}} + \frac{\Delta L}{\Delta K_{\text{T}}} \quad \text{where K- torsional stiffness for a given distance between flange mating faces, K_{\text{T}}- torsional stiffness shown in the catalogue, <math>\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta K_{\text{T}}-$  torsional stiffness

- 4. The standard distance between shaft ends S is in accordance with the requirements in section 8.3, API671(the 4-th edition). The "minimum" coupling length B is referred to as the shortest length which meets the conditions of part machining technology and installing space for the structure. The "minimum" coupling length should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# TDR Series

especially suitable for high speed applications where the requirements for additional

- ◆ Small external sizes with the hubs in the inversion form, small additional bending moment.
- ◆ Smaller additional bending moment than TDS series,
- bending moment are ultra rigorous.

  Interlocking flanges. Double way transmitting arrangement, able to protect the turbine machines from load throw-off.
- ◆Factory-assembled flexible unit, dynamic balance precision well
- ◆Adjusting shims provided to adjust magnitude of pre-stretching or
- ◆ Keyless interference fit for hub—shaft connection is recommended.

### Direction for use

- 1. Coupling length B, bore diameter D, hub outside diameter C, hub length E, distance between shaft ends S may be designed separately according to the matching requirements of the machines
- 2. Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended by TRUMY.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting
double key connection	P7	Hot mounting	
Interference fit, without key connection	Bore tolerance defined ac magnitude of interference by the calculation according	Hot mounting or oil pressure mounting	

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between shaft ends. For other sizes of bore diameter, hub outside diameter and distance between shaft ends, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between shaft ends the torsional stiffness K can be calculated using the formula as follows

$$\frac{1}{K} = \frac{1}{K_T} + \frac{\Delta L}{\Delta K_T} \quad \text{where K- torsional stiffness for a given distance between flange mating faces, K_T- torsional stiffness shown in the catalogue, $\Delta K_T$- torsional stiffness for spacer tube per meter as shown in the catalogue, $\Delta L$- variation of size F relative to TRUMY standard distance between flange mating faces.}$$

- 4. The standard distance between shaft ends S is in accordance with the requirements in section 8.3, API671(the 4—th edition). The "minimum" coupling length B is referred to as the shortest length which meets the conditions of part machining technology and installing space for the structure. The "minimum" coupling length should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

# TDX Series

- An option especially suitable for middle/high speed applications where DBSE is limited.
- ◆Small dimensions, compact structure.
- ◆Enable the disc pack to be replaced separately.

# Direction for use

RSV Industries Pvt. Ltd. www.rsvindustries.com sales@rsvindustries.com

- Bore diameter D, hub outside diameter C, hub length E, distance between flange mating faces F may be designed separately according to the matching requirements of the machines. The TRUMY recommended "F" will also be your preferred selection in order to obtain optimum price and shorter lead time.
- Based on the needs the connection between the driving and driven machines may be designed with taper bored hub(with or without key), flange, spline, etc. For straight bore connection to be applied the hub-shaft fit types list in the table are recommended by TRUMY.

Fit type	Bore tolerance for hub	Recommendation for shaft tolerance	Mounting method				
Interference fit, with single or	H7	r6 s6 t6 u6	Hot mounting				
double key connection	P7	Hot mounting					
Interference fit, without key connection	Bore tolerance defined ac magnitude of interference by the calculation according	cording to shaft tolerance, needed can be determined ng to GB/T 5371 or API671.	Hot mounting or oil pressure mounting				

3. In the catalogue the total weight, centre of gravity, torsional stiffness and moment of inertia are calculated according to max. allowable bore diameter, max. hub outside diameter, standard distance between flange mating faces. For other sizes of bore diameter, hub outside diameter, distance between flange mating faces, above mentioned parameters should be calculated or corrected separately, where the torsional stiffness is taken in the fitting section of the shaft. For various distances between flange mating faces the torsional stiffness K can be calculated using the formula as follows:

 $\frac{1}{K} = \frac{1}{K_{\text{T}}} + \frac{\Delta L}{\Delta K_{\text{T}}} \quad \text{where K- torsional stiffness for a given distance between flange mating faces, K_{\text{T}}- torsional stiffness shown in the catalogue, <math>\Delta K_{\text{T}}-$  torsional stiffness for spacer tube per meter as shown in the catalogue,  $\Delta L-$  variation of size F relative to TRUMY standard distance between flange mating faces.

- 4. The "minimum" distance between flange mating faces F is referred to as the shortest distance between flange mating faces which meets the conditions of part machining technology and installing space for the structure. The "minimum" distance should not be selected as far as possible. If shorter distances are needed, please consult TRUMY sales engineer.
- 5. Peak torque rating is the max. torque the coupling can tolerate for short period. Momentary torque limit is the torque that corresponds to a fator of safety of 1.0 with respect to the most highly stressed component's material yield strength, allowing for a combination of speed, angular misalignment and axial displacement.
- 6. If you have any questions or any other particular requirements, please consult TRUMY sales engineer.

## **Description of TRUMY coupling balance**

- 1. Owing to precise positioning of coupling parts in design and precise machining, TRUMY high speed flexible disc couplings have been well balanced. The coupling parts should be carefully handled in processes of storage, transportation and installation in order to ensure high dynamic balancing quality. The couplings for delivery tested by dynamic balancing should be aligned with match marks inscribed after balancing, when mounted.
- 2. To ensure repeatability of balance the rabbets are usually used for centering of the removable parts of a high speed coupling. A great attention should be paid to protecting of those rabbets in processes of storage, transportation and installation. For a few product series diaphragms or discs are combined with the connected parts in a Factory–assembled flexible unit which is not allowed to be disassembled on the site of installation.
- On the basis of the concrete coupling design and working conditions our company can conduct coupling balancing according either to the company norms or to the procedures
  corresponding to the standard API 671 alternatively. The coupling balance precision is not lower than ISO1940–G1.6.
- 4. The maximum allowable speed values listed in the catalogue are company guided ones on the basis of the coupling structure characteristics and balance precision. If a higher speed is needed, please select TRUMY diaphragm coupling series or consult with the sales engineer of our company.

# Description of compensating capability, axial force and angular bending moment

Transmitting torque and motion, the coupling in operation has to endure angular and radial misalignments and axial displacement simultaneously, as shown in the figure. The capability for compensating radial misalignment, a function of angular deformation and distance between the ends of shafts, is usually realized by angular deformation of the flexible elements. Deformations of the coupling, when in operation, should not beyond the range of permissible misalignments.

The flexible elements with axial deformation will generate axial bounce force (axial force), while angular deformation will lead to angular bounce moment (angular bending moment). The relation between axial force, angular bending moment and deformation is illustrated as follows:

Range of allowable misalignments

# Specialized design to meet customer particular requirements

- For pumps, fans, compressors driven by electromotors, internal combustion engines or other middle/low speed applications, please select TRUMY low & middle speed flexible disc coupling series.
- For some low speed applications TRUMY grid coupling series may be selected.
